jc491 U.S. PTO 11/17/97

FORM PTO-1082 Case Docket No. RKPA1

THE COMMISSIONER OF PATENTS AND TRADEMARKS
Washington D.C. 20231

Sir:

Transmitted herewith for filing is the patent application of inventor: Ray D. Kanter residing at Dallas, Texas
for: **SHOCK ABSORBING CARPET SYSTEM**

Enclosed are:

1sheet of drawings

An assignment of this invention to none.

A Declaration and Authorization of Agent

A verified statement to establish small entity status under 37 CFR 1.9 and CFR 1.27.

The filing fee has been calculated as follows:

			ENTITY SIZE			
	(Col. 1)	(Col. 2)	SMALL		OTHER	
FOR	NO. FILED	NO. EXTRA	RATE	FEE	RATE	FEE
BASIC FEE			$395 or		$790	
TOTAL CLAIMS	15 -20	= 0	X11=$ or		X22=$	
IND. CLAIMS	3 -3	= 0	X41=$ or		X82=$	
MULTIPLE INDEPENDENT CLAIM			+135=$_or		+270=$____	
If the difference in Col. 1 is less than zero, enter 0 in Col. 2.			TOTAL	$395 or	TOTAL$	

A duplicate copy of this sheet is enclosed.

A check in the amount of $395.00 to cover the filing fee is enclosed.

SHOCK ABSORBING CARPET SYSTEM

Cross-Reference to Related Applications: None.

Background of the Invention:

Related Prior Art

In U.S. Patent 5,658,430 issued to Drake and Herrin in 1997 there is illustrated new wall to wall carpeting applied directly over worn carpeting having a backing secured to a hard floor surface, by spraying an adhesive onto the top pile surface of the old carpet.

In U.S. Patent 4,647,484 issued to Higgins in 1983 there is illustrated an underlay for carpets having a scrim supported lower foam rubber portion and a Mylar® upper portion having adhesive on both sides to provide an attachment to the lower portion and an adhesive upper portion for attachment to a carpet tile. The upper portion is protected by a release paper, which is removed before installation.

In U.S. Patent 5,304,268 issued to Hoopengardner in 1994 there is illustrated a carpet pad having a pressure sensitive adhesive for retaining the carpet and pad in place on a floor.

In U.S. Patent 4,990,399 issued to Hoopengardner in 1991 there is illustrated a carpet cushion of compressible foam having a pressure sensitive adhesive applied for retaining the carpet and pad in place on a floor, and having a spacer element laid into the adhesive after the adhesive is applied.

In U.S. Patent 4,804,567 issued to Reuben in 1989 there is illustrated an automobile carpet having a carpet pad attaching means removably connected by a pressure

sensitive adhesive.

In U.S. Patent 4,797,170 issued to Hoopengardner in 1989 there is illustrated a carpet and pad with a pressure sensitive adhesive on one surface.

In U.S. Patent 4,557,774 issued to Hoopengardner in 1989 there is illustrated a carpet and pad with a pressure sensitive adhesive on its upper and lower surface.

In U.S. Patent 5,160,770 issued to Hoopengardner in 1992 there is illustrated a carpet and pad with a sealed surface and pressure sensitive adhesive applied to one or both sealed surfaces of the pad. Also illustrated is application of a hot melt pressure sensitive adhesive onto an unsealed pad surface.

Field of the Invention

In the installation of carpeting, it is known to place a carpet mat made of urethane foam or other open cell compressible material between the carpet and the floor. It is also known to use a pressure sensitive adhesive to bond the carpet to the carpet mat, and/or to bond the carpet mat to the floor. These inventions have been applied to wall to wall carpet systems. Because of the permeability of conventional carpet mat materials, undesirable wicking of the adhesive material into the mat occurs. Additionally, conventional systems are designed for comfortable walking, but provide inadequate protection during a fall.

It is desirable to eliminate the problem of wicking of adhesive material into the compressible material of the carpet mat. It is also desirable to develop a shock absorbing carpet system that protects people from injury in the event of a fall, where activity is such that a fall is likely. Places where the likelihood of a fall exists often

host a variety of different events, or the use of a space of multiple utility, with varying requirements for the size and design of the flooring. Accordingly, there is a need for a shock absorbing carpet mat assembly that is both portable and configurable, into a variety of shapes and sizes.

Brief Summary of the Invention:

A carpet assembly with shock absorbing properties for preventing injury comprising a mat of closed cell foam composition having shock damping properties and having a top side and a bottom side and predetermined thickness and perimeter edges connecting the top side and the bottom side; a layer of pressure sensitive adhesive covering the top side of the mat, a layer of carpet having a top side and a bottom side, the bottom side of the carpet being fastened in contact with the pressure sensitive adhesive for adherence thereto. Preferably, the mat is substantially 1 1/8 inch thick, and has impact attenuation in compliance with ASTM F-1292-96. The present invention is directed to the problem of safety in the design of flooring where people are likely to fall down, such as, playgrounds, child care centers, gymnasiums, and the like. These areas often require portability of such flooring systems, size variation, and reconfiguration of the shape of the system, as the nature of the events may demand. The present invention may be installed wall to wall or as a portable system to cover only an area as required for an activity such as gymnastics. By incorporating a mat with an impact attenuation that satisfies ASTM F-1292-96, the present invention provides a safe flooring system for a variety of applications where people are likely to fall down. The present invention eliminates undesirable wicking of the adhesive and the need for intermediate sealing systems, by using a closed cell carpet mat, which allows direct application of the adhesive.

Brief Description of the Drawings:

FIG. 1 is a cross-sectional view of a shock absorbing carpet mat assembly formed in accordance with this invention.

FIG. 2 is a top view of a shock absorbing carpet mat assembly showing multiple sections attached together in accordance with this invention.

Detailed Description:

FIG. 1 is a cross-sectional view of a shock absorbing carpet mat assembly **1**. The assembly includes a mat section **2** made of a closed cell material. In the preferred embodiment, mat section **2** has a thickness of 1 1/8" or other as necessary to meet ASTM F-1292-96. Variations in density and hardness of the mat, however, may allow a mat as thin as 1/2". I believe that with present materials, the mat should be at least 1/2" thick. In the preferred embodiment, mat section **2** is made in sections 4' x 6'. The top side **3** of the mat section **2**, is coated with a layer of pressure sensitive adhesive **4**. Prior to assembly, the pressure sensitive adhesive **4** is covered with a removable liner (not shown) on the side opposite the mat section **2** to protect the pressure sensitive adhesive **4** from contact with any other surface during shipping and handling. The removable liner is removed to expose the surface of the pressure sensitive adhesive **4** prior to installation of the carpet **5**. To install the carpet **5**, the bottom side of the carpet **6** is place in direct contact with the pressure sensitive adhesive **4** and bonded thereto. The perimeter edges **7** of the mat section **2** may have Velcro® **8** attached. The Velcro® **8** allows easy attachment of other mat sections to create a larger, removable, protective floor surface. The Velcro® **8** also allows attachment of edge molding **9**. The edge molding **9** provides a perimeter of the shock

absorbing carpet mat assembly **1** that is both aesthetically appealing and protective. Alternatively, edge molding **9** can be permanently attached to mat section **2** and carpet **5**, with a contact cement or other adhesive.

FIG. 2 is a top view of a shock absorbing carpet mat assembly **1** showing multiple sections **10** attached contiguously together. The sections are attached by means of the Velcro® **8** along the perimeter edges **7** of each mat section **2**. If the multiple sections **10** do not complete a carpet assembly that is wall to wall in a room, the outside edge **11** of the multiple sections **10** can have edge molding **9** attached, preferably with contact cement. Preferably the edge molding is of closed cell foam, similar or identical to the mat **2**. Preferably, Velcro® is affixed to at least one perimeter edge of each individual assembly for detachably attaching multiple sections of the carpet mat assembly into a unit.

The American Society for Testing and Materials has issued ASTM F-1292-96 Standard Specification for Impact Attenuation of surface Systems Under and Around Playground Equipment. This specification limits the maximum impact force to 200 times the force of gravity, from a specified height. My carpet mat assembly in the preferred embodiment limits a fall from 48 inches to the specified impact limit. Applications of carpet mats need to be adapted to the potential fall distance of a person walking on the mat, or on top of any equipment above the mat.

I am disclosing a carpet assembly with shock absorbing properties for preventing injury comprising; a mat of closed cell foam composition having shock damping properties and having a top side and a bottom side and predetermined thickness and perimeter edges connecting said top side and said bottom side; a layer of pressure sensitive

adhesive covering the top side of the mat, a layer of carpet having a top side and a bottom side, the bottom side of the carpet being fastened in contact with the pressure sensitive adhesive for adherence thereto. I am further disclosing a carpet mat assembly having a removable liner covering the pressure sensitive adhesive on the top side of the mat to protect the pressure sensitive adhesive from contact with any other surface, prior to fastening the carpet to the mat. I am further disclosing the method of manufacturing a carpet mat assembly steps of applying contact cement to one side of a closed cell foam mat having shock damping properties and having a predetermined thickness, and adhering the bottom side of a carpet, having a top side and a bottom side, to the pressure sensitive adhesive. Preferably, the method includes the additional steps after the step of applying the contact cement of applying a removable liner to the contact cement, and removing the removable liner prior to applying the carpet to the mat.

Although elements of the invention have been illustrated in the accompanying drawings and described in the foregoing description it will be understood that the invention is not limited to the embodiments disclosed, but is capable of rearrangements, modifications, substitutions and reversals of parts and elements without departing from the spirit of the invention.

I claim:

1. A carpet assembly with shock absorbing properties for preventing injury comprising;

a mat of closed cell foam composition having shock damping properties and having a top side and a bottom side and predetermined thickness and perimeter edges connecting said top side and said bottom side;

a layer of pressure sensitive adhesive covering the top side of the mat,

a layer of carpet having a top side and a bottom side, the bottom side of the carpet being fastened in contact with the pressure sensitive adhesive for adherence thereto.

2. A carpet mat assembly according to claim 1, further comprising:

a removable liner covering the pressure sensitive adhesive on the top side of the mat to protect the pressure sensitive adhesive from contact with any other surface, prior to fastening the carpet to the mat.

3. A carpet mat assembly as in claim 2, wherein the mat is substantially 1 1/8 inch thick.

4. A carpet mat assembly as in claim 2, wherein the mat has impact attenuation in compliance with ASTM F-1292-96.

5. A carpet mat assembly as in claim 2, wherein the mat is at least 1/2 inch thick.

6. A carpet mat assembly as in claim 2, wherein the assembly is made of like portable sections secured contiguously together.

7. A carpet mat assembly as in claim 6, wherein the perimeter dimensions of the assembly are substantially 4 feet wide and 6 feet long.

8. A carpet mat assembly as in claim 6, wherein an edge molding is attached to at least one perimeter edge of the carpet mat.

9. A carpet mat assembly as in claim 8, wherein the edge molding is attached to at least one perimeter edge of the carpet mat assembly with a contact adhesive.

10. A carpet mat assembly as in claim 8, wherein the edge molding is closed cell foam.

11. A carpet mat assembly as in claim 8, wherein 3M Velcro® is affixed to at least one perimeter edge of each individual assembly for detachably attaching multiple sections of the carpet mat assembly into a unit.

12. The method of manufacturing a carpet mat assembly comprising:

applying contact cement to one side of a closed cell foam mat having shock damping properties and having a predetermined thickness, and

adhering the bottom side of a carpet, having a top side and a bottom side, to the pressure sensitive adhesive.

13. The method of claim 12 having additional steps after the step of applying the contact cement:

applying a removable liner to the contact cement, and

removing the removable liner prior to applying the carpet to the mat.

14. The method of claim 12 having additional step of:

applying an edge molding to said at least one perimeter edge of the carpet mat.

15. The method of claim 14 having additional step of:

applying Velcro® to said least one perimeter edge of the carpet mat.

Abstract of the Disclosure:

A carpet mat assembly with shock absorbing properties includes a mat made of closed cell foam sections. The mat sections are sized to be readily portable, preferably 4ft by 6ft in size. The mat thickness is selected to conform to ASTM F1292-96. Preferably, the mat thickness is 1 1/8" thick. The mat section is coated with a pressure sensitive adhesive covering on one side of the mat. The pressure sensitive adhesive is covered with a removable liner. The liner is removed to expose the pressure sensitive adhesive. Carpet is applied to the coated surface of the mat and the pressure sensitive adhesive bonds the carpet to the mat. The outer perimeters of each mat may be lined with 3M Velcro® for attaching multiple sections of the carpet mat assembly securely together. On the outer perimeter of mat sections not joined to other mat sections, an edge molding preferably made from the same closed cell foam, may be attached to the mat with a contact adhesive, or by other means. The completed assembly provides a floor or ground surface safe for playgrounds, schools, child care centers, martial arts, gymnasiums or other areas where shock absorbing surfaces are required.

DECLARATION
AUTHORIZATION OF AGENT
AND PETITION

I, Ray D. Kanter residing in Dallas, Texas declare that I am a citizen of the United States of America, and that I have reviewed and understand the foregoing specification and claims, and that I verily believe that I am the sole, original, and first inventor of the invention **SHOCK ABSORBING CARPET SYSTEM** described and claimed herein; that I do not know and do not believe that this invention was ever known or used before my invention thereof, or patented or described in any printed publication in any country before my invention thereof, or more than one year prior to this application; or in public use or on sale in the United States more than one year prior to this application; that this invention has not been patented in any country foreign to the United States on an application filed by me or my legal representatives or assigns more than twelve months before this application. I acknowledge my duty to disclose information of which I am aware which is material to the examination of this application in accordance with 37 CFR section 1.56(a).

And I hereby appoint Morgan L. Crow Reg. No. 25,622, as my Patent Agent with Authorization of Agent with full power of substitution and revocation to prosecute this application and to transact all business in the Patent and Trademark Office connected herewith, and request that all correspondence about the application be addressed to Morgan L. Crow, 113 Ashburne Glen Lane, Ovilla, TX, 75154. Direct telephone calls to 972-217-1717.

I declare further that all statements made herein of my own knowledge are true and that all statements made on knowledge and belief are believed to be true; and further that these statements are made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application of any patent issuing thereon.

WHEREFORE, I pray that Letters Patent be granted to me for the invention described and claimed in the foregoing specification and claims, and I hereby subscribe my name to the foregoing specification and claims, declaration, authorization of agent and this petition.

Sole Inventor Ray D. Kanter
